Subject: Installation of Safety Pressure Monitoring Caps on Tires

Please note that when installing the Final Coat Safety Pressure Monitoring Caps on the valve stems of tires on any vehicle, we recommend that you DO NOT install them on vehicles which are equipped with factory TPMS (Tire Pressure Monitoring System).

The valve stems on tires equipped with TPMS are usually made of aluminum and may expand when hot. Since the Final Coat Caps are made of steel, this may cause the valve stems to become very tight inside the caps and it will become very difficult to remove the caps later.

Since these vehicles are already equipped with a tire pressure monitoring system, there is no need to install exterior valve stem monitoring caps.

For further information, please contact your Final Coat service rep or contact our office at:
